Instant Same-chain and Cross-chain Swaps at the Best Possible Price

Relay enables both same and cross-chain swaps on supported chains. We couple robust meta-aggregation of the best onchain swap providers with the low-cost and instant speed of the Relay Network to deliver best-in-class any-to-any swaps on all our supported networks.

Swap Meta-Aggregation - We aggregate the best swap providers across crypto to deliver the best routes for onchain swaps

Instant Cross-chain Swaps - Relay's median bridge time is 2.7 seconds across chains.

Multi-VM Support - Relay Supports major EVM chains, as well as Bitcoin, Solana, Sui, Tron, Eclipse, and more.

Gasless Support - Relay supports gasless swaps via native support of 4337 account abstraction, 7702 support, and gasless permit execution (3009 and 2612)

App Fees - Our comprehensive approach to [App Fees](#) lets you easily earn when using Relay. Additionally, we have designed our fee system for you to automatically collect fees in stables (USDC).

How it Works

When a user wishes to swap, they receive a quote from Relay that describes the time and cost of swapping. When they accept the quote, the order is validated and they either execute their same-chain swap (same-chain) or submit a deposit to the [Relay Depository Contract](#) (cross-chain), where a relayer then instantly fills the transaction on the destination chain before unlocking the funds on the origin.

To learn how to integrate Relay into your application, check out our [Quickstart Guide](#).
